

## The application of Cavex Temporary Cement

Cavex Temporary Cement is especially designed for luting **individually** made temporary crowns and bridges.

Temporary Cement needs the right balance between strength and adhesion to dentine/resin. A higher strength means stronger seating and a lower adhesion means easy removal of excess.

For Cavex Temporary Cement we assume that dentists make individually temporary crowns and bridges from resin, where you need only a thin layer of cement. Thick layers of the cement cause breakage in the cement and premature loss of temporary crowns.
