EX SENSE

desensitizer

Sensitive teeth often occur as a result of dental erosion or exposed dentin. This effective desensitizer is a Medical Device class IIa that meets all European requirements for safety, health and environment in Europe.

Cavex ExSense is based on 2% hydroxyapatite that seals the tubules and microcracks in the enamel using a hydro-dispersing sol. In doing so, it completely closes off sensitive areas. The addition of 0.1% potassium nitrate also restores the micro-hardness of the elements.

Application

The desensitizer prevents any sensitivity. Besides prevention, it provides instant, long-term relief against chronic and acute sensitivity of the elements.

The pleasant tasting gel can be applied in two ways: by rubbing in gently with the finger or by wearing it in a tray for about ten minutes. Due to its easy application, Cavex ExSense can be used by practitioners in the practice as well as by patients at home.

Features

- Hydroxyapatite seals the tubules and microcracks
- Prevents and reduces sensitivity of the teeth
- Accelerates the remineralization process
- Pleasant (mint) taste
